MSc DSAIB 2026–2027

Case 02

From a client enquiry to a feasible proposal

AFTERNOON AI SOLUTION SPRINT · Shubin YU

3 hours · Choose one of five cases · Groups of 1–3 (solo welcome)

BrightRoom · Small business-event studio

THE BUSINESS SITUATION

BrightRoom organises half-day workshops for small companies. A salesperson receives informal enquiries such as “a team day for about 15 people, with food, within a modest budget.” They clarify the brief, consult a short catalogue, calculate a package and write a proposal. Much of this work repeats, but every enquiry contains different constraints.

The founder wants a first proposal prepared faster, with fewer missing requirements and calculation errors. A persuasive proposal is useful only if the package fits the brief. When the request cannot be met, the salesperson needs a clear explanation and a realistic alternative, rather than an invented service or a hidden budget overrun.

Build a reusable AI solution that turns a client enquiry into a structured brief and a draft proposal, or into the clarification needed before a proposal can be made.

REQUIREMENTS

- Extract headcount, duration, budget, required services and accessibility needs. Separate confirmed requirements, optional preferences and missing information.
- Use only the catalogue. Show itemised prices and a correct total; identify any requirement or budget the proposed package cannot satisfy.
- Offer an alternative only when its trade-offs are explicit. Do not silently change a must-have requirement to make the numbers work.
- Keep the output a draft for salesperson approval. Availability is unconfirmed; do not book a venue or promise a date, discount or unlisted service.

DECISIONS FOR YOUR GROUP

- When should the solution ask a question, and when can it provide a provisional proposal with labelled assumptions?
- Which work benefits from GenAI, and which calculations or constraints are better handled with rules or code?
- How will the salesperson see that a polished proposal is infeasible before sending it?

Possible measures: preparation time, constraint satisfaction, correct totals and useful clarification. Evaluate whether the proposal is usable, not only whether it sounds persuasive.

The company, records and messages are fictional teaching material. No external research or live business integration is needed.

Case 02 · Starter pack

Copy these materials into your chosen tool. Add labelled variations for testing.

APPROVED CATALOGUE

ID / item	Price	Conditions
V1 · Studio	€240	4 hours; maximum 12 people; stairs only; Wi-Fi included.
V2 · Loft	€420	4 hours; maximum 24 people; wheelchair accessible; Wi-Fi included.
S1 · Coffee break	€8/person	One coffee break for every attendee.
S2 · Lunch	€18/person	One lunch for every attendee; vegetarian/vegan on request. No allergen guarantee is supplied.
S3 · Projector	€35	One projector for the booking.
S4 · Facilitator	€280	One facilitator for 2 hours.

For this classroom case, all prices are total amounts in euros: add no taxes or other fees. Select one venue; flat-price items can be added once. Per-person services cover the full headcount. No longer-duration price or discount is available. Dates require a separate availability check.

CLIENT ENQUIRIES TO TRY

ID	Enquiry
Q1	10 people, 4 hours, coffee for everyone. Maximum budget €350.
Q2	20 people, 4 hours, coffee and lunch are required. Total budget €850.
Q3	10 people, 4 hours, wheelchair access, coffee and a projector. Budget €600.
Q4	Can you organise a team workshop next month? Please send me your best offer.
Q5	30 people for 6 hours with lunch. We can spend €1,500. Please confirm it today.

USEFUL SCOPE BOUNDARY

Your prototype only needs this catalogue and a text enquiry. A reusable proposal workflow is enough; a booking website or a real payment integration is unnecessary. You may generate additional enquiries without changing the catalogue facts.

MSc DSAIB 2026–2027

Your 3-hour build and submission

Choose ONE of the five cases · Work alone or in a group of 1–3

CHOOSE YOUR SOLUTION

Use any 5A form or combination: Access, Assistants, Applications, Automation or Agents. A reusable prompt workflow can qualify; demonstrate that it handles new inputs. Agentic patterns are optional. Justify the complexity you choose.

Use any coding agent or other AI tool, including Claude Code, Codex, Antigravity, OpenCode or Mimiwork. Check tool/model access. Use the supplied fictional data; label any additions or simulated integrations.

SUGGESTED 3-HOUR PLAN

Elapsed time	Stage	Work to complete
00:00–00:20	Scope · 20 min	Choose one user, workflow, EDGE target and success measure. Set a baseline: a manual process, template or single prompt.
00:20–02:00	Build · 100 min	Select your 5A form and build a reusable prototype. Make sources, missing information and human review visible.
02:00–02:40	Test · 40 min	Run at least 10 small tests against the same baseline. Include routine, missing-information and difficult cases; improve the solution.
02:40–03:00	Submit · 20 min	Record the demo video and package the appendix with your solution and evidence.

SUBMIT TWO ITEMS

1. Demo video — suggested length: 3–5 minutes. State the problem, user and value target; explain your solution choice. Show the working prototype on a routine input and a difficult or failure case. Summarise your test results, limitations and next improvement.

2. Appendix — your solution and evidence. This can be a document, notebook, assistant/workflow export or ZIP of solution files. Include:

- A short design rationale: workflow, 5A choice and trade-offs, human responsibilities and EDGE target (Efficiency, Decisions, Growth or Empowerment).
- What is needed to reproduce the demo: solution files or prompts/configuration, data, tool/model details and brief run instructions. Include group members' names and contributions.
- A compact test table: at least 10 inputs or test conditions, expected behaviour, baseline and prototype results, and pass/fail judgments. Summarise quality, time and cost; label estimates or unavailable measures.

The prototype, rationale and test evidence belong inside these two submissions; no separate slide deck or report is required. A static example alone is not a reusable solution.

EVALUATION CRITERIA

Business value: A clear user need, meaningful baseline and measurable benefit.

Design choices: A justified 5A form, useful GenAI contribution and appropriate human control.

Reliability: A working, reproducible solution that handles missing information and exposes limits.

Evidence: Fair tests and honest trade-offs. Extra agents or code do not earn credit by themselves.
